

DAY6

WHAT IS ANIMATION IN CSS

CSS animation is a technique to change the appearance and behavior of the element

It is used to control the element by changing the display and motions.

CSS animation contains two parts:

First part describes the css properties which define the animations of the element.

Second part called the timeframe defines the animation property and the time interval in which it is to occur.

WHY DO WE USE KEYFRAMES?

Keyframes are foundation for building animations in css.

They define the display of animation at different stages of its cycle.

It basically provides when and where to stop

At what time the style or animation changes.

CAN WE APPLY MORE THAN ONE CSS CLASS IF YES HOW TO IMPLEMENT IT.

Yes, more than one css class can be implemented in a document.

`` This allows you to combine several classes.
