

### Why do we use value attribute of <option> tag

- The value attribute in the <option> tag is used to specify the value associated with each option in a dropdown list. This value is what gets sent to the server when the user selects an option from the list.
- Defines the text for the input type.

### What is <input type="hidden">

- To input hidden/confidential information.
- Inputs data that cannot be seen or modified by the users when the form is submitted.
- Although the data can be edited/modified from browser developer tool.

### Difference between <input type=submit> and <button>

- <input type="submit"> is used for submitting documents.
- The content of the input submit is given with the value attribute.
- Less styling options.
- <button> submit creates a clickable button with opening and closing button tags
- These are connected to other pages through hyperlinks
- Wide variety of styling options are available for buttons

### How to select multiple items in a drop down list

The drop down list can be created using form.

Select and option are the tags which are required to be used under the form to create multiple options for a drop down menu

Ex.

```
<form>
```

```
<select id="se">
```

```
<option> java </option>
```

```
<option> c++</option>
```

```
<option> python </python>
```

```
</select>
```

```
</form>
```
